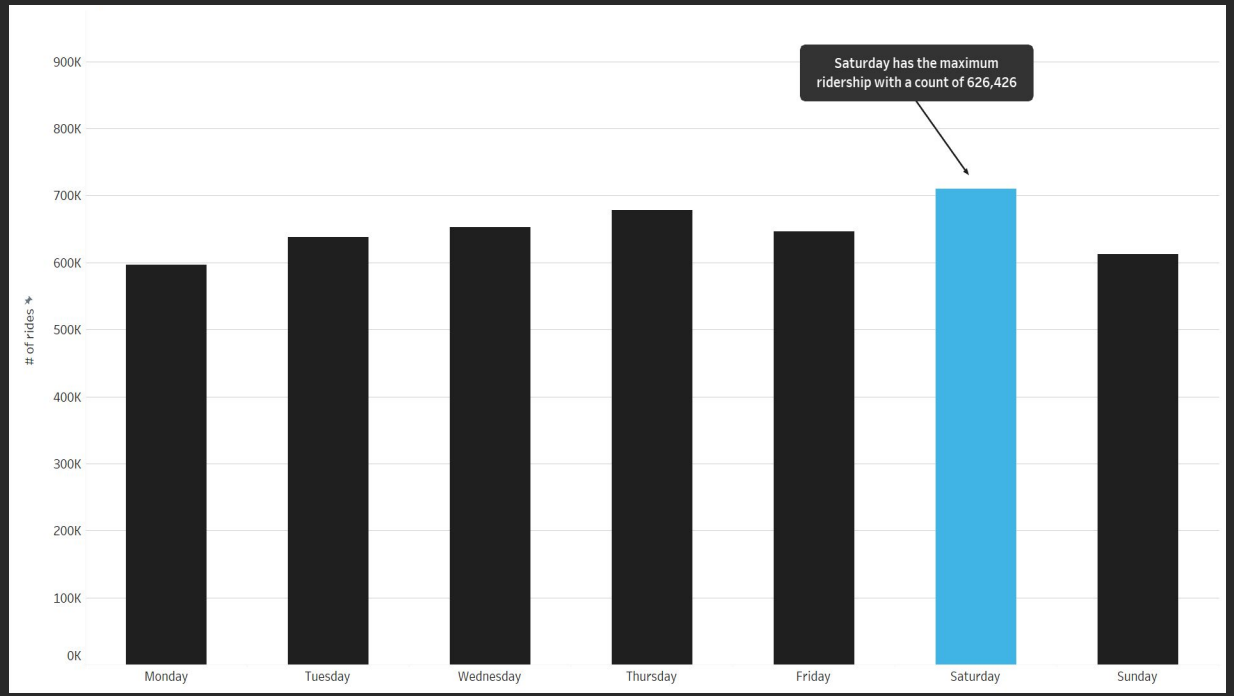
- Recommendations

Objective

- ➔ To clean and analyze Cyclistic (Divvy) public data to identify trends and demographics in ridership.
- ➔ Guide data-driven decision making in marketing to improve casual rider conversion.

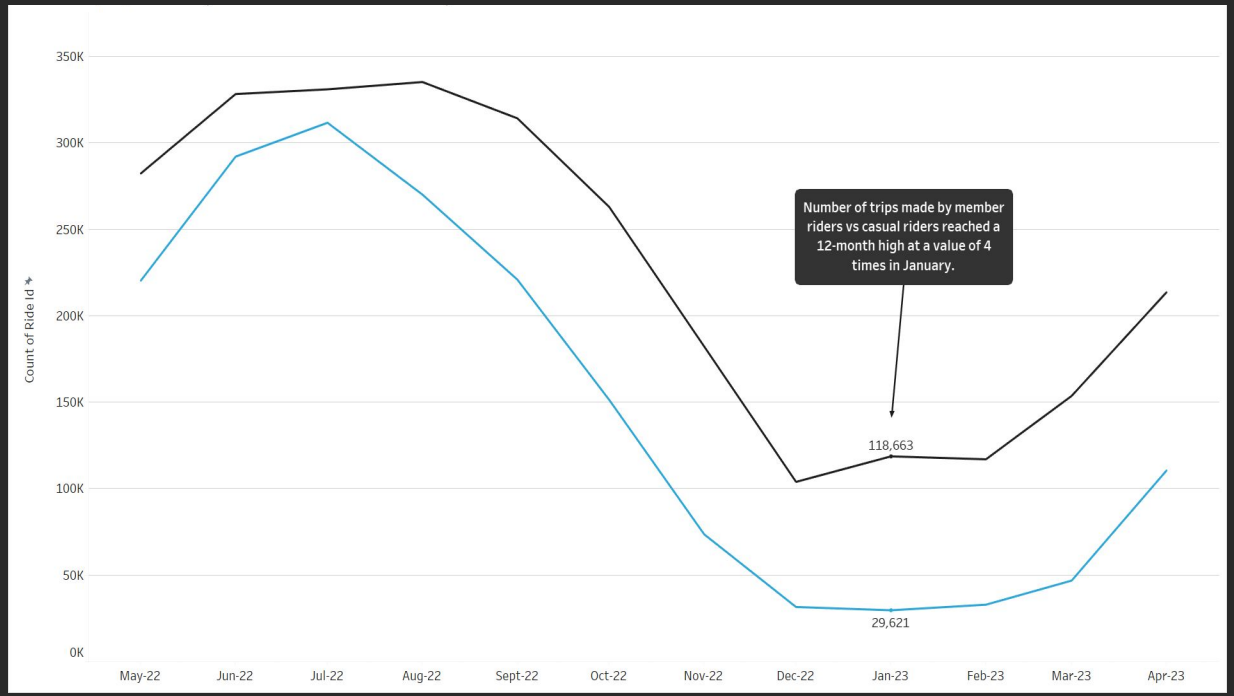
Ridership by Weekday

- Total ridership peaks on the weekend, specifically Saturdays
- Supports use of Cyclistic bikes for leisure more than work.



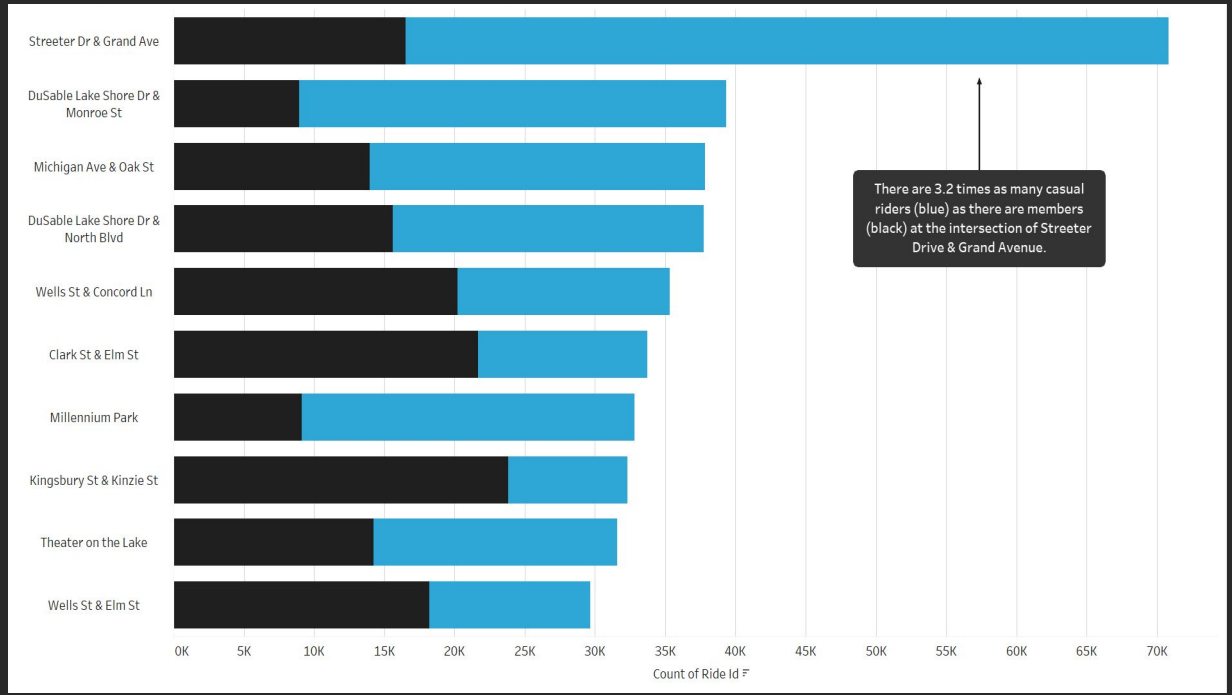
Ridership by Month

- Total ridership peaked at 642,680 in the summer
- Bottomed at 135,403 in the winter because of road and climate conditions.



Ridership by Start Station

- Casual trips made 76% of all trips from Streeter Dr & Grand Ave
- Around 70% of all trips made from the top 3 stations were casual



Findings

- ➔ Although data on weekend ridership supports use of Cyclistic bikes for leisure, the drop in total ridership on Sundays could be explained by higher inclination to stay home.
- ➔ Data from December 2022 indicates that total ridership hit a twelve-month low while the member-to-casual ratio peaked. This is likely due to members wanting to make the most of their subscription.
- ➔ Street Dr & Grand Ave receives the most traffic at two times as much as the second busiest station. Casual riders make up 76% of all trips due to the station being located near a tourist attraction: Navy Pier.

Limitations

- Ride figures are limited to observations with start and end station data.
- Ridership by month only traces back to the previous year and no further back.

Recommendations

- ➔ Promote routes/activities, and offer discounts to casual riders on weekends to increase Sunday ridership.
- ➔ Create a referral program to reduce the ratio between member and casual riders for the winter months.
- ➔ Increase marketing at the Street Dr & Grand Ave station to attract the high amount of casual riders.

Thank You
